# The Equity Constraint Channel of Monetary Policy

Heitor Almeida, Timothy Johnson, Sebastião Oliveira, Yucheng Zhou

Discussant: Philip Coyle

EFA 2026

# What the Paper Shows—and My Question

**Core result**

- Financing source predicts MP exposure.
- FCE falls more than FCD after tightening.
- CAPX, R&D, patents amplify the gap.
- New draft adds model and investor tests.

# What the Paper Shows—and My Question

**Core result**

- Financing source predicts MP exposure.
- FCE falls more than FCD after tightening.
- CAPX, R&D, patents amplify the gap.
- New draft adds model and investor tests.

**Why I like it**

- The financing-source question is right.
- Linn–Weagley buys useful coverage.
- R&D and patent asymmetry is strong.
- The revision takes mechanism seriously.

# What the Paper Shows—and My Question

**Core result**

- Financing source predicts MP exposure.
- FCE falls more than FCD after tightening.
- CAPX, R&D, patents amplify the gap.
- New draft adds model and investor tests.

**Why I like it**

- The financing-source question is right.
- Linn–Weagley buys useful coverage.
- R&D and patent asymmetry is strong.
- The revision takes mechanism seriously.

**My discussion:** *What really drives FCE $>$ FCD result?*

1. Does the pecking-order mapping matter for FCE/FCD responses?
2. Can moving debt capacity also generate FCE $>$ FCD?

# What Identifies the FCE–FCD Differential?

**Observed fact:** FCE firms respond more than FCD firms.

# What Identifies the FCE–FCD Differential?

**Observed fact:** FCE firms respond more than FCD firms.

**Authors' mechanism**

- FCD firms respond through debt finance.
- FCE firms respond through equity finance.
- Pecking order holds:
  internal funds first, debt next, equity last.
- Equity response larger: $\rho_E > \rho_B$.

# What Identifies the FCE–FCD Differential?

**Observed fact:** FCE firms respond more than FCD firms.

**Authors' mechanism**

- FCD firms respond through debt finance.
- FCE firms respond through equity finance.
- Pecking order holds:
  internal funds first, debt next, equity last.
- Equity response larger: $\rho_E > \rho_B$.

**My added questions**

*If pecking order fails:*

- FCE/FCD may not map to equity/debt.
- $\rho_E > \rho_B$ is not enough.

*If pecking order holds:*

- FCE also means little debt headroom.
- Tightening may move debt capacity.

# What Identifies the FCE–FCD Differential?

**Observed fact:** FCE firms respond more than FCD firms.

**Authors' mechanism**

- FCD firms respond through debt finance.
- FCE firms respond through equity finance.
- Pecking order holds:
  internal funds first, debt next, equity last.
- Equity response larger: $\rho_E > \rho_B$.

**My added questions**

*If pecking order fails:*

- FCE/FCD may not map to equity/debt.
- $\rho_E > \rho_B$ is not enough.

*If pecking order holds:*

- FCE also means little debt headroom.
- Tightening may move debt capacity.

**Two concepts I will come back to in this discussion**

- **Financing premia:** $\rho_E$ is equity response; $\rho_B$ is debt response.
- **Debt capacity** ($\mu$): how much debt the firm can carry before equity is forced.

# Comment 1: Does Pecking Order Hold for FCE/FCD?

**The mechanism is relying heavily on the pecking order hypothesis**

$$\underbrace{\text{FCE}}_{\text{classified by equity use}} \Rightarrow \underbrace{\text{equity funds the next dollar}}_{\text{exposure } \rho_E},$$

$$\underbrace{\text{FCD}}_{\text{classified by debt use}} \Rightarrow \underbrace{\text{debt funds the next dollar}}_{\text{exposure } \rho_B}.$$

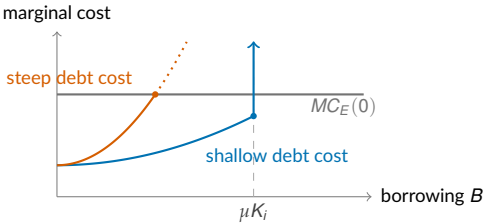
# Comment 1: Does Pecking Order Hold for FCE/FCD?

**The mechanism is relying heavily on the pecking order hypothesis**

$$\underbrace{\text{FCE}}_{\text{classified by equity use}} \Rightarrow \underbrace{\text{equity funds the next dollar}}_{\text{exposure } \rho_E},$$

$$\underbrace{\text{FCD}}_{\text{classified by debt use}} \Rightarrow \underbrace{\text{debt funds the next dollar}}_{\text{exposure } \rho_B}.$$

**That pecking-order mapping can fail before the borrowing limit binds.**



$$MC_B(B_i) \geq MC_E(0) \quad \text{with} \quad B_i < \mu K_i.$$

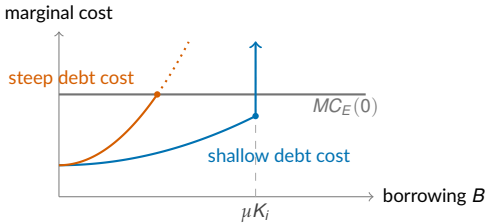
# Comment 1: Does Pecking Order Hold for FCE/FCD?

**The mechanism is relying heavily on the pecking order hypothesis**

$$\underbrace{\text{FCE}}_{\text{classified by equity use}} \Rightarrow \underbrace{\text{equity funds the next dollar}}_{\text{exposure } \rho_E},$$

$$\underbrace{\text{FCD}}_{\text{classified by debt use}} \Rightarrow \underbrace{\text{debt funds the next dollar}}_{\text{exposure } \rho_B}.$$

**That pecking-order mapping can fail before the borrowing limit binds.**



$$MC_B(B_i) \geq MC_E(0) \quad \text{with} \quad B_i < \mu K_i.$$

**Then equity finance can appear before the firm hits their borrowing limit.**

# If Financing Sources Mix, Premia Are Not Enough for FCE $>$ FCD

**Let $w_g$ be group $g$'s equity share of next-dollar external finance.**

$$\bar{\rho}_g = \underbrace{w_g}_{\text{equity share}} \rho_E + \underbrace{(1 - w_g)}_{\text{debt share}} \rho_B, \qquad g \in \{FCE, FCD\}.$$

# If Financing Sources Mix, Premia Are Not Enough for FCE $>$ FCD

**Let $w_g$ be group $g$'s equity share of next-dollar external finance.**

$$\bar{\rho}_g = \underbrace{w_g}_{\text{equity share}} \rho_E + \underbrace{(1 - w_g)}_{\text{debt share}} \rho_B, \qquad g \in \{FCE, FCD\}.$$

**The FCE–FCD differential factors into two objects.**

$$\bar{\rho}_{FCE} - \bar{\rho}_{FCD} = \underbrace{(w_{FCE} - w_{FCD})}_{\text{pecking-order mapping}} \underbrace{(\rho_E - \rho_B)}_{\text{premium differential}}.$$

# If Financing Sources Mix, Premia Are Not Enough for FCE $>$ FCD

**Let $w_g$ be group $g$'s equity share of next-dollar external finance.**

$$\bar{\rho}_g = \underbrace{w_g}_{\text{equity share}} \rho_E + \underbrace{(1 - w_g)}_{\text{debt share}} \rho_B, \qquad g \in \{FCE, FCD\}.$$

**The FCE–FCD differential factors into two objects.**

$$\bar{\rho}_{FCE} - \bar{\rho}_{FCD} = \underbrace{(w_{FCE} - w_{FCD})}_{\text{pecking-order mapping}} \underbrace{(\rho_E - \rho_B)}_{\text{premium differential}}.$$

- $\rho_E > \rho_B$ is enough only if $w_{FCE} > w_{FCD}$.
- That is where pecking order has to hold.

# If Financing Sources Mix, Premia Are Not Enough for FCE $>$ FCD

**Let $w_g$ be group $g$'s equity share of next-dollar external finance.**

$$\bar{\rho}_g = \underbrace{w_g}_{\text{equity share}} \rho_E + \underbrace{(1 - w_g)}_{\text{debt share}} \rho_B, \qquad g \in \{FCE, FCD\}.$$

**The FCE–FCD differential factors into two objects.**

$$\bar{\rho}_{FCE} - \bar{\rho}_{FCD} = \underbrace{(w_{FCE} - w_{FCD})}_{\text{pecking-order mapping}} \underbrace{(\rho_E - \rho_B)}_{\text{premium differential}}.$$

- $\rho_E > \rho_B$ is enough only if $w_{FCE} > w_{FCD}$.
- That is where pecking order has to hold.

**The pecking-order link is $w_{FCE} > w_{FCD}$.**

# Empirically, Who Are the Equity-Constrained Firms?

**FCE can describe two different economic states.**

$$\underbrace{B_i \simeq \mu K_i}_{\text{debt constrained}} \quad \Rightarrow \text{equity is forced by binding debt capacity,}$$

$$\underbrace{B_i < \mu K_i}_{\text{debt unconstrained}} \quad \Rightarrow \text{equity is chosen despite debt headroom.}$$

# Empirically, Who Are the Equity-Constrained Firms?

**FCE can describe two different economic states.**

$$\underbrace{B_i \simeq \mu K_i}_{\text{debt constrained}} \quad \Rightarrow \text{equity is forced by binding debt capacity,}$$

$$\underbrace{B_i < \mu K_i}_{\text{debt unconstrained}} \quad \Rightarrow \text{equity is chosen despite debt headroom.}$$

**This is the empirical version of pecking order:** $w_{FCE} > w_{FCD}$.

# Empirically, Who Are the Equity-Constrained Firms?

**FCE can describe two different economic states.**

$$\underbrace{B_i \simeq \mu K_i}_{\text{debt constrained}} \quad \Rightarrow \text{equity is forced by binding debt capacity,}$$

$$\underbrace{B_i < \mu K_i}_{\text{debt unconstrained}} \quad \Rightarrow \text{equity is chosen despite debt headroom.}$$

**This is the empirical version of pecking order:** $w_{FCE} > w_{FCD}$.

**Empirical ask: split FCE firms by debt headroom.**

- Do high-response FCE firms have less headroom?
- Do they draw debt, issue equity, or both after tightening?
- Is $w_{FCE}$ high even among debt-unconstrained FCE firms?

# Empirically, Who Are the Equity-Constrained Firms?

**FCE can describe two different economic states.**

$$\underbrace{B_i \simeq \mu K_i}_{\text{debt constrained}} \quad \Rightarrow \text{equity is forced by binding debt capacity,}$$

$$\underbrace{B_i < \mu K_i}_{\text{debt unconstrained}} \quad \Rightarrow \text{equity is chosen despite debt headroom.}$$

**This is the empirical version of pecking order:** $w_{FCE} > w_{FCD}$.

**Empirical ask: split FCE firms by debt headroom.**

- Do high-response FCE firms have less headroom?
- Do they draw debt, issue equity, or both after tightening?
- Is $w_{FCE}$ high even among debt-unconstrained FCE firms?

**Pin down whether FCE firms are debt constrained or unconstrained.**

# Comment 2: Debt Capacity Can Also Move

**Counterfactual:** same premium shock, but tightening reduces debt headroom.

$$\underbrace{\rho}_{\text{common premium shock}} \qquad \underbrace{\mu}_{\text{capacity parameter}} \qquad \underbrace{\mu K_i}_{\text{borrowing limit}} \qquad \underbrace{\mu K_i - B_i}_{\text{debt headroom}}$$

$$\rho_E = \rho_B = \rho > 0, \qquad \mu'(\varepsilon^{MP}) < 0.$$

# Comment 2: Debt Capacity Can Also Move

**Counterfactual:** same premium shock, but tightening reduces debt headroom.

$$\underbrace{\rho}_{\text{common premium shock}} \qquad \underbrace{\mu}_{\text{capacity parameter}} \qquad \underbrace{\mu K_i}_{\text{borrowing limit}} \qquad \underbrace{\mu K_i - B_i}_{\text{debt headroom}}$$

$$\rho_E = \rho_B = \rho > 0, \qquad \mu'(\varepsilon^{MP}) < 0.$$

**Then the investment response has same "group" ordering, but different interpretation.**

$$\text{FCD/debt-focused:} \quad |I'_D| \propto \overbrace{\Delta r + \rho}^{\text{price shock}},$$

$$\text{FCE/equity-focused:} \quad |I'_E| \propto \overbrace{\Delta r + \rho}^{\text{same price shock}} + \overbrace{\text{lost headroom}}^{\text{capacity shock}}.$$

# Comment 2: Debt Capacity Can Also Move

**Counterfactual:** same premium shock, but tightening reduces debt headroom.

$$\underbrace{\rho}_{\text{common premium shock}} \qquad \underbrace{\mu}_{\text{capacity parameter}} \qquad \underbrace{\mu K_i}_{\text{borrowing limit}} \qquad \underbrace{\mu K_i - B_i}_{\text{debt headroom}}$$

$$\rho_E = \rho_B = \rho > 0, \qquad \mu'(\varepsilon^{MP}) < 0.$$

**Then the investment response has same "group" ordering, but different interpretation.**

$$\text{FCD/debt-focused:} \quad |I'_D| \propto \overbrace{\Delta r + \rho}^{\text{price shock}},$$

$$\text{FCE/equity-focused:} \quad |I'_E| \propto \overbrace{\Delta r + \rho}^{\text{same price shock}} + \overbrace{\text{lost headroom}}^{\text{capacity shock}}.$$

**FCE $>$ FCD can come from lost headroom, even if $\rho_E = \rho_B$.**

# Debt Headroom Is Part of Interpretation

**Debt headroom:** unused borrowing capacity before the constraint binds.

$$\text{headroom}_i = \mu K_i - B_i.$$

# Debt Headroom Is Part of Interpretation

**Debt headroom:** unused borrowing capacity before the constraint binds.

$$\text{headroom}_i = \mu K_i - B_i.$$

- The paper lets monetary policy move debt prices: $\rho_B > 0$.
- But borrowing capacity, $\mu K_i$, is held fixed.
- Tightening can raise haircuts or rollover pressure.
- In notation, $\mu' < 0$ means lower debt capacity.

# Debt Headroom Is Part of Interpretation

**Debt headroom:** unused borrowing capacity before the constraint binds.

$$\text{headroom}_i = \mu K_i - B_i.$$

- The paper lets monetary policy move debt prices: $\rho_B > 0$.
- But borrowing capacity, $\mu K_i$, is held fixed.
- Tightening can raise haircuts or rollover pressure.
- In notation, $\mu' < 0$ means lower debt capacity.

**This matters for exactly the firms in question:**

- FCE is *defined* by $B_i = \mu K_i$.
- Firms near the limit can switch regimes after a tightening.
- The FCD/FCE boundary can move with the shock.

# Debt Headroom Is Part of Interpretation

**Debt headroom:** unused borrowing capacity before the constraint binds.

$$\text{headroom}_i = \mu K_i - B_i.$$

- The paper lets monetary policy move debt prices: $\rho_B > 0$.
- But borrowing capacity, $\mu K_i$, is held fixed.
- Tightening can raise haircuts or rollover pressure.
- In notation, $\mu' < 0$ means lower debt capacity.

**This matters for exactly the firms in question:**

- FCE is *defined* by $B_i = \mu K_i$.
- Firms near the limit can switch regimes after a tightening.
- The FCD/FCE boundary can move with the shock.

**Decompose the gap: premium differential versus capacity movement.**

# Within FCE, authors compare high- and low-transient ownership firms

$\underbrace{\text{FCE-H}}_{\text{high transient ownership}}$ v. $\underbrace{\text{FCE-L}}_{\text{low transient ownership}}$ .

# Within FCE, authors compare high- and low-transient ownership firms

$$\underbrace{\text{FCE-H}}_{\text{high transient ownership}} \quad \text{v.} \quad \underbrace{\text{FCE-L}}_{\text{low transient ownership}} \; .$$

**A larger FCE-H response has two interpretations.**

Equity-supply channel: $\rho_E(\textit{FCE-H}) > \rho_E(\textit{FCE-L})$,

Debt-capacity channel: $\mu_i$ is lower for FCE-H.

# Within FCE, authors compare high- and low-transient ownership firms

$$\underbrace{\text{FCE-H}}_{\text{high transient ownership}} \quad \text{v.} \quad \underbrace{\text{FCE-L}}_{\text{low transient ownership}} \quad .$$

**A larger FCE-H response has two interpretations.**

Equity-supply channel: $\rho_E(\textit{FCE-H}) > \rho_E(\textit{FCE-L})$,

Debt-capacity channel: $\mu_i$ is lower for FCE-H.

**Part of paper speaks to this, but not decisively.**

- FCE-H and FCE-L are not distinguished by leverage: 0.153 vs. 0.167.
- But leverage is not capacity, and no capacity proxy is in the table.
- FCE-H firms are younger and smaller—correlates of less collateral.

# Within FCE, authors compare high- and low-transient ownership firms

$$\underbrace{\text{FCE-H}}_{\text{high transient ownership}} \quad \text{v.} \quad \underbrace{\text{FCE-L}}_{\text{low transient ownership}} \; .$$

**A larger FCE-H response has two interpretations.**

Equity-supply channel: $\rho_E(\textit{FCE-H}) > \rho_E(\textit{FCE-L})$,

Debt-capacity channel: $\mu_i$ is lower for FCE-H.

**Part of paper speaks to this, but not decisively.**

- FCE-H and FCE-L are not distinguished by leverage: 0.153 vs. 0.167.
- But leverage is not capacity, and no capacity proxy is in the table.
- FCE-H firms are younger and smaller—correlates of less collateral.

**Ask:** split FCE on usable undrawn committed capacity, then on transient ownership.

# Within FCE, authors compare high- and low-transient ownership firms

$$\underbrace{\text{FCE-H}}_{\text{high transient ownership}} \quad \text{v.} \quad \underbrace{\text{FCE-L}}_{\text{low transient ownership}} \; .$$

**A larger FCE-H response has two interpretations.**

Equity-supply channel: $\rho_E(\textit{FCE-H}) > \rho_E(\textit{FCE-L})$,

Debt-capacity channel: $\mu_i$ is lower for FCE-H.

**Part of paper speaks to this, but not decisively.**

- FCE-H and FCE-L are not distinguished by leverage: 0.153 vs. 0.167.
- But leverage is not capacity, and no capacity proxy is in the table.
- FCE-H firms are younger and smaller—correlates of less collateral.

**Ask:** split FCE on usable undrawn committed capacity, then on transient ownership.

**The split identifies equity supply if FCE-H is not also lower debt capacity FCE.**

# Takeaway

**Great paper with a very interesting & robust empirical fact.**

1. FCE contains information standard constraint proxies miss.
2. The equity interpretation is compelling if FCE means equity finance.
3. But FCE may also mean little debt headroom.

**The remaining question is its interpretation.**
**Look forward to next version of the paper!**
